

#	Prompt	Version	Types of Failure Observed
1	Classify this customer message: "I love this product! It's exactly what I needed."	V1 Simple	1. Formatting: result is "Positive" vs. **Positive** 2. Grammar: use of capitals or lower case "Positive" vs. "positive" 3. Ommision: "customer satisfaction" vs. "satisfaction"
	Classify this customer message using a single word. Choose from the following words "Very Satisfied", "Satisfied", "Unsatisfied", "Very Unsatisfied": "I love this product! It's exactly what I needed."	V2 Elaborate	Consistent results
	Classify this customer message: "I love this product! It's exactly what I needed." Example Output: "Very Satisfied"	V3 One-Shot	Consistent results, however prompt was shorter to get the same results that above.
	Classify this customer message: "I dislike this product! It doesn't work most of the time and I want to return it." Example Output: "Very Unsatisfied"	V4 Variation	Consistent results with opposite conclusion to above.
2	Create a product description for a wireless mouse that costs \$29.99.	V1 Simple	1. Halucination: product described as "precision mouse" vs. "comfort mouse" which seriously changes the nature of the add 2. Features: highlighting different features "color options" vs. "easy setup" there is little consistency here with what it chooses 3. Target audience: in some adds it targets professionals, in other gamers, students etc.
	Create a product description for a wireless mouse that costs \$29.99. The target audience is a student with a low budget, they would be interested in shape and color options only. Ensure the length is no more than 50 words, do not use bullet points, natural text only with a bold header.	V2 Elaborate	1. Headings: "Affordable mouse" vs. "Stylish and productive" the second option is a clear divergence from the specific instructions to stay focused on color and shape only 2. Target audience: all examples were quite different but focus stayed on students as target audience
	Create a product description for a wireless mouse that costs \$29.99. Example Output should include: 1. Target audience as student 2. Length no more than 50 words 3. Example output: "Cheap & chearful, this mouse has everything a student needs at a price they can afford."	V3 One-Shot & Structured Output	More consistent results, nearly all results started the same for the first half "Affordable and efficient, this wireless mouse is perfect for students on the go." It then starts to drift between responses, but in a much more predictable way
	Create a product description for a laptop that costs \$500. Example Output should include: 1. Target audience as students going back to school in September 2. Length no more than 50 words 3. Example output: "Powerful yet affordable, this laptop will help student's succeed at whatever challenges the semester can throw at them	V4 Variation	In this example the results actually got worse than the V3 example though the prompts were structurally similar, somehow the AI interpreted it differently and every response was quite different and in many cases quite far from the instructions. An example I liked, not for good reasons, but personally entertaining "Academic Ally" for a laptop.
3	Extract information from this customer feedback: "I ordered item #12345 on March 15th. The delivery was fast but the packaging was damaged."	V1 Simple	1. Formatting: **package condition:** vs. package condition 2. Consistency: Package condition vs. Issue 3. Confusion: Damaged packaging vs. damaged, this is more severe as it changes the resulting actions to be taken
	Extract key information from this customer feedback such as "Item number", "order date." State key details from the message and return a plain text response summary no more than 25 words: "I ordered item #12345 on March 15th. The delivery was fast but the packaging was damaged."	V2 Elaborate	Consistent results
	First extract item number, then order date, and finally delivery and packaging: "I ordered item #12345 on March 15th. The delivery was fast but the packaging was damaged."	V3 Chain of Thought	Consistent results with slight formatting inconsistency where sometimes '-' was added to points. Otherwise the prompt was more efficient.
	"The order was damaged on delivery and I would like my money back, my item was #12345 which I ordered on March 10th, please accept my return immediately!" From the above customer feedback: first extract item number, then order date, and finally a one word summary of the state of the order on delivery.	V4 Variation	Consistent results and the formatting issue vanished, I could see the AI generating the '-' and then quietly removing it. Very odd behavior.
